REPORT OF DAY 7

Introduction

This report summarizes the activities completed during the M-Tech Production & Marketing AI/ML Internship Program on **4th July 2026**. Today, a new project titled **Employee Attrition Predictor** was assigned as part of the internship. The project involves developing a Machine Learning-based desktop application in Python using Tkinter to predict whether an employee is likely to leave a company based on employee-related information.

Objectives

- Understand the requirements of the **Employee Attrition Predictor** project.
- Analyze the project scope and expected features.
- Prepare a development plan before implementation.
- Identify the Python libraries and Machine Learning techniques required for the project.
- Build a strong understanding of the project before starting development.

Task Description

The assigned project requires developing a complete desktop application named **Employee Attrition Predictor** using Python and Tkinter. The application will include data preprocessing, Machine Learning model training, prediction functionality, model evaluation, and a professional graphical user interface. Additional features such as prediction history, model saving, graphs, and documentation are also part of the project requirements.

Work Done

Today, I carefully reviewed the complete project requirements and understood the objectives of the **Employee Attrition Predictor** project. I analyzed the required features, project structure, Python libraries, and Machine Learning workflow that will be implemented during development. I also reviewed the expected application modules, including data preprocessing, model training, prediction, and graphical user interface development, to prepare for the implementation phase.

Challenges Faced

No major challenges were encountered today since the project was assigned for future development. The main task was understanding the project requirements and planning the overall workflow. Reading through the detailed specifications helped me gain a clear understanding of the project objectives.

Key Learnings

Today's work helped me understand the planning phase of a Machine Learning project. I learned about the different components required to build a complete AI-powered desktop application, including data preprocessing, model training, graphical user interface design, and project organization. This gave me a clear roadmap for the development process.

Conclusion

Today marked the beginning of the **Employee Attrition Predictor** project. Reviewing the project requirements and understanding its objectives provided a clear direction for the development process. With a proper understanding of the project scope and expected features, I am prepared to begin implementing the application in the upcoming internship tasks.
